Profile

Full-stack developer with 3 years of experience building production-ready AI platforms, serverless backends, and complex frontends. Owns features end-to-end - from system design through release and monitoring - across B2B SaaS, consumer search platforms, and AI-powered products. Strong focus on edge infrastructure, multi-provider LLM integrations, and clean, maintainable architecture.

Skills

- Front-end: JavaScript, TypeScript, React, Next.js, React Native (Expo), Vite, React Hook Form, React Admin, React Router, Headless UI, Tailwind CSS, Material UI, Storybook, Zustand, Redux Toolkit, TanStack Query, Zod, HTML5, CSS3 / SCSS.
- Back-end: Node.js, Hono, NestJS, Express, Cloudflare Workers (Durable Objects, Queues, Hyperdrive, KV, R2, D1, Turnstile, Vectorize), PostgreSQL, MongoDB, MongoDB Atlas Search, MySQL, Drizzle ORM, Prisma, REST APIs, Swagger, Twilio, SendGrid, Airtable, GitHub API.
- AI/ML: OpenRouter, OpenAI, LLM Tool Calling, Agentic Pipelines, RAG (Cloudflare Vectorize), Cursor, Claude.
- DevOps: Git, GitHub Actions, Cloudflare, Firebase (Auth, Realtime DB, Storage, Functions), Google Cloud (Storage, Text-to-Speech, Cloud Run), Docker, Heroku.

Experience

April 2024 - Present - DevelopsToday, Full-Stack Developer

Project: Creator AI CRM.

Description: A B2B SaaS platform that helps digital creator agencies automate fan conversations, content sales, and subscription management using AI.

Achievements:

- Planned the architecture and built a serverless platform on Cloudflare Workers with a webhook-driven AI pipeline that handles fan DMs and PPV content sales automatically - reducing agency operators' manual work by an estimated 40% by shifting them from full-time chatting to handling exceptions only.
- Built a RAG-powered media recommendation engine (Cloudflare Vectorize + OpenRouter) with 24-hour purchase attribution - giving agencies direct visibility into AI-generated PPV revenue, LLM cost per conversation, fan satisfaction rate, and escalation volume.
- Delivered a full admin SPA with multi-profile AI configuration, fan subscription automation, vault media management, content sequencing, and ops dashboards showing AI-vs-human message volume and attributed revenue.

Environment: TypeScript, Cloudflare (Workers, Queues, Durable Objects, KV, R2, Vectorize), Hono, Drizzle ORM, PostgreSQL, OpenRouter API, Zod, React, React Admin, Material UI, React Router.

Project: AI Chat & Media Generator.

Description: An AI chat API and two embeddable widgets - a chat widget and an AI image/video generator - for a consumer subscription platform, with multi-provider LLM conversations, async media generation, and a gems/VIP monetization system.

Achievements:

- Built a multi-provider AI layer that lets the platform switch models and providers at runtime through config - no code changes or redeployment needed. Ran two API versions in production at the same time, migrating all clients to the new version with zero breaking changes.

- Built an async image/video generation pipeline: users submit a request, the system polls an external diffusion service via webhooks with automatic retries, and shows a live queue position and progress bar based on rolling average generation time.
- Enforced dual monetization on every generation - per-use gems and a VIP subscription tier - checked and settled against the platform's central points balance on both the client and server side.
- Shipped the chat widget and media generator as two independently deployable Vite bundles pushed to Cloudflare R2 via a custom upload script - so either frontend updates without touching the API release cycle. Added Google Cloud TTS voice replies and Cloudflare Turnstile bot protection.

Environment: TypeScript, Cloudflare Workers, Hono, Cloudflare Hyperdrive (MySQL), Cloudflare Secrets Store, Cloudflare R2, Cloudflare Turnstile, OpenRouter API, Google Cloud Text-to-Speech,, React 18/19, Vite, Tailwind CSS 4.

Project: Creator Discovery Platform.

Description: A high-traffic B2C search and discovery platform indexing 1M+ creator profiles and thousands of user-submitted reviews across OnlyFans, Patreon, and similar platforms.

Achievements:

- Managed the full project to move search from Elasticsearch to MongoDB Atlas Search for 1M+ profiles - removing extra server costs while keeping search speed and quality the same. Rebuilt ranking as compound Atlas queries with a custom score blending subscriber and like counts.
- Expanded SEO coverage with a dynamic XML sitemap for every active creator URL and per-platform review index, and refactored the existing Next.js 14 codebase to fix critical bugs and improve client-side page load speed.
- Shipped moderation tools that keep search and reviews clean at scale: real-time banned-word filtering on queries, image/IP/email banning, and an admin queue for reported reviews.

Environment: TypeScript, Next.js 14 (Pages Router, SSR), React 18, Express, Node.js 20, MongoDB, MongoDB Atlas Search, Firebase (Authentication, Cloud Functions, Hosting), Google Cloud Storage, Tailwind CSS, Headless UI, React Query, React Hook Form.

Project: Link Sites Dashboard.

Description: An internal tool for managing and deploying static landing-page sites - one per creator - replacing manual work across GitHub, Cloudflare, and Airtable with a single dashboard.

Achievements:

- Found slow work processes and used independent problem solving skills to build a new tool: replaced manual work by letting users select creator names and use GitHub Actions to deploy up to 10 sites at once.
- Gave each site its own live status page with a one-click deploy button, cutting the time to redeploy a single site from several manual steps across three tools to a single action.
- Added AI-generated error summaries: when a build fails, the tool reads the full GitHub Actions log and writes a short plain-language summary - so engineers skip raw log scrolling entirely.

Environment: TypeScript, React, Cloudflare (Workers, Hono, D1, KV), GitHub API, Cloudflare API, Airtable API, OpenAI API.

Project: Community Mobile App.

Description: A consumer mobile app giving small communities - friend groups, clubs, parent groups, volunteer organizations - one shared space for group chat, events, and tasks.

Achievements:

- Built phone OTP onboarding with duplicate-account protection using Twilio SMS verification - new members can join in under a minute.
- Made group onboarding effortless: invite directly from phone contacts or by email with one-tap join from an invite link, and automated invite emails sent the moment someone is added via SendGrid.
- Replaced scattered chat apps, calendar tools, and to-do lists with one shared realtime workspace per group - powered by Firebase Realtime Database subscriptions with per-member task ownership and attendance tracking.

Environment: TypeScript, React Native, Expo (Expo Router), Firebase (Authentication, Realtime Database, Storage, Cloud Functions), Twilio, SendGrid.

October 2023 - December 2023 - IVMIT, Front-End Developer

Project: Travel Agency Booking Platform.

Description: A multilingual Next.js booking site for a travel agency, letting visitors search and filter tours, view tour details, and complete multi-passenger bookings with phone verification and online payment.

Achievements:

- Built the booking flow end-to-end: tour search and filtering, a multi-passenger order form with per-passenger validation, an SMS-code verification step before order details are shown, and an embedded LiqPay checkout with signed payment data and success/error redirects.
- Implemented locale detection and routing with Next.js Edge Middleware that reads the visitor's browser language and redirects to the right locale, backed by per-language dictionaries for all site copy.
- Built the marketing and discovery pages with image and itinerary sliders and responsive layouts, plus a dynamically generated sitemap and robots rules covering every tour page for SEO.

Environment: JavaScript, Next.js (App Router), React, Tailwind CSS, React Hook Form, LiqPay, Heroku.

Education

2021 - 2025 - Bachelor's degree in Computer Science - National Technical University of Ukraine 'Kyiv Polytechnic Institute'.
